

# Potential Energy Surface Transition State

# Making INPUT 1

- First lines are input of method and basis set
  - #P HF/STO-3G pop=reg
- Empty line
- Title of the calculation: Anything is OK
- Empty line
- Charge and spin multiplicity: usually we consider neutral molecule so charge 0, multiplicity is number of unpaired electrons +1, usually we consider filled electron so 1

# Making INPUT 2

- Then define the molecule either using **XYZ** or **Z-matrix** input

```
O1
O2  1,  RO1O2
H3,  2,  RO2H3,  1,  AO1O2H3
H4,  1,  RO1H4,  2,  AO2O1H4,  3,  DH3O2O1H4

RO1O2=1.50845307
RO2H3=0.97
RO1H4=0.97
AO1O2H3=110.0
AO2O1H4=110.0
DH3O2O1H4=109.
```

O1	0.000000	0.754227	-0.058812
O2	0.000000	-0.754227	-0.058812
H3	-0.742068	-1.085986	0.470499
H4	0.742068	1.085986	0.470499

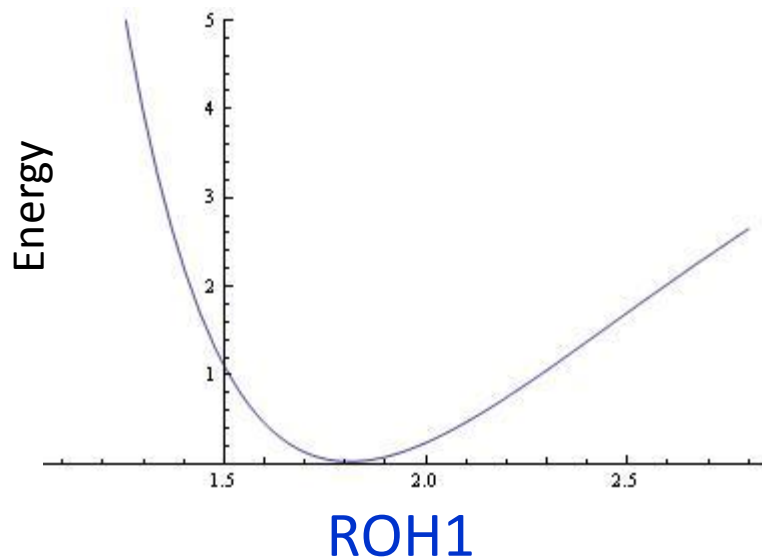

- Then end with one blank line

# Review

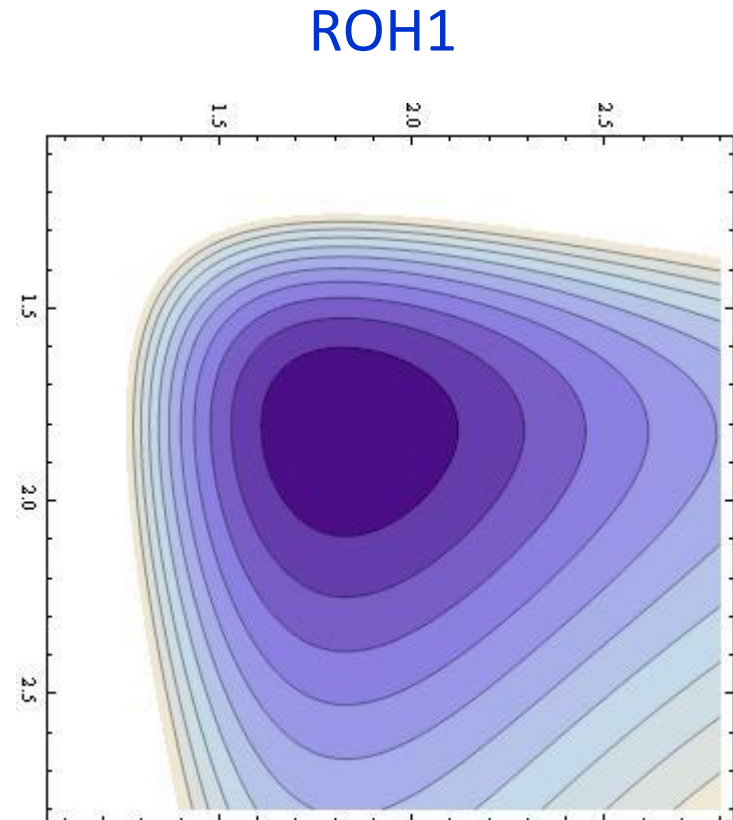

- Last week we did diatomic molecules with only one bond so we only have to think about forming a bond or breaking that bond
- Today we will consider something more complex molecules
- Then we will make and break a bond at the same time REACTION

# Water Molecule

## Potential Energy Curve

# Water Molecule: Stretch Stretch Potential Energy Surface

# Water Molecule: Stretch Bend Potential Energy Surface

# Normal Mode Vibration

First we consider mass –weight Cartesian Coordinates

Next expand the potential energy to second term near equilibrium

$$V = V(0) + \sum_I^{3N} K_I q_I + \frac{1}{2} \sum_I^{3N} \sum_J^{3N} K_{IJ} q_I q_J = \frac{1}{2} \sum_I^{3N} \sum_J^{3N} K_{IJ} q_I q_J$$

Total energy is given as

← Cross term

If we **diagonalize**  $K_{IJ}$

Motion described by  $3N-6$  (5 for linear molecule) **NORMAL MODES**

5/6 Modes that are ignored have zero  $\lambda_i$  **TRANSLATION/ROTATION**

# Normal Modes of Water

Symmetric stretch

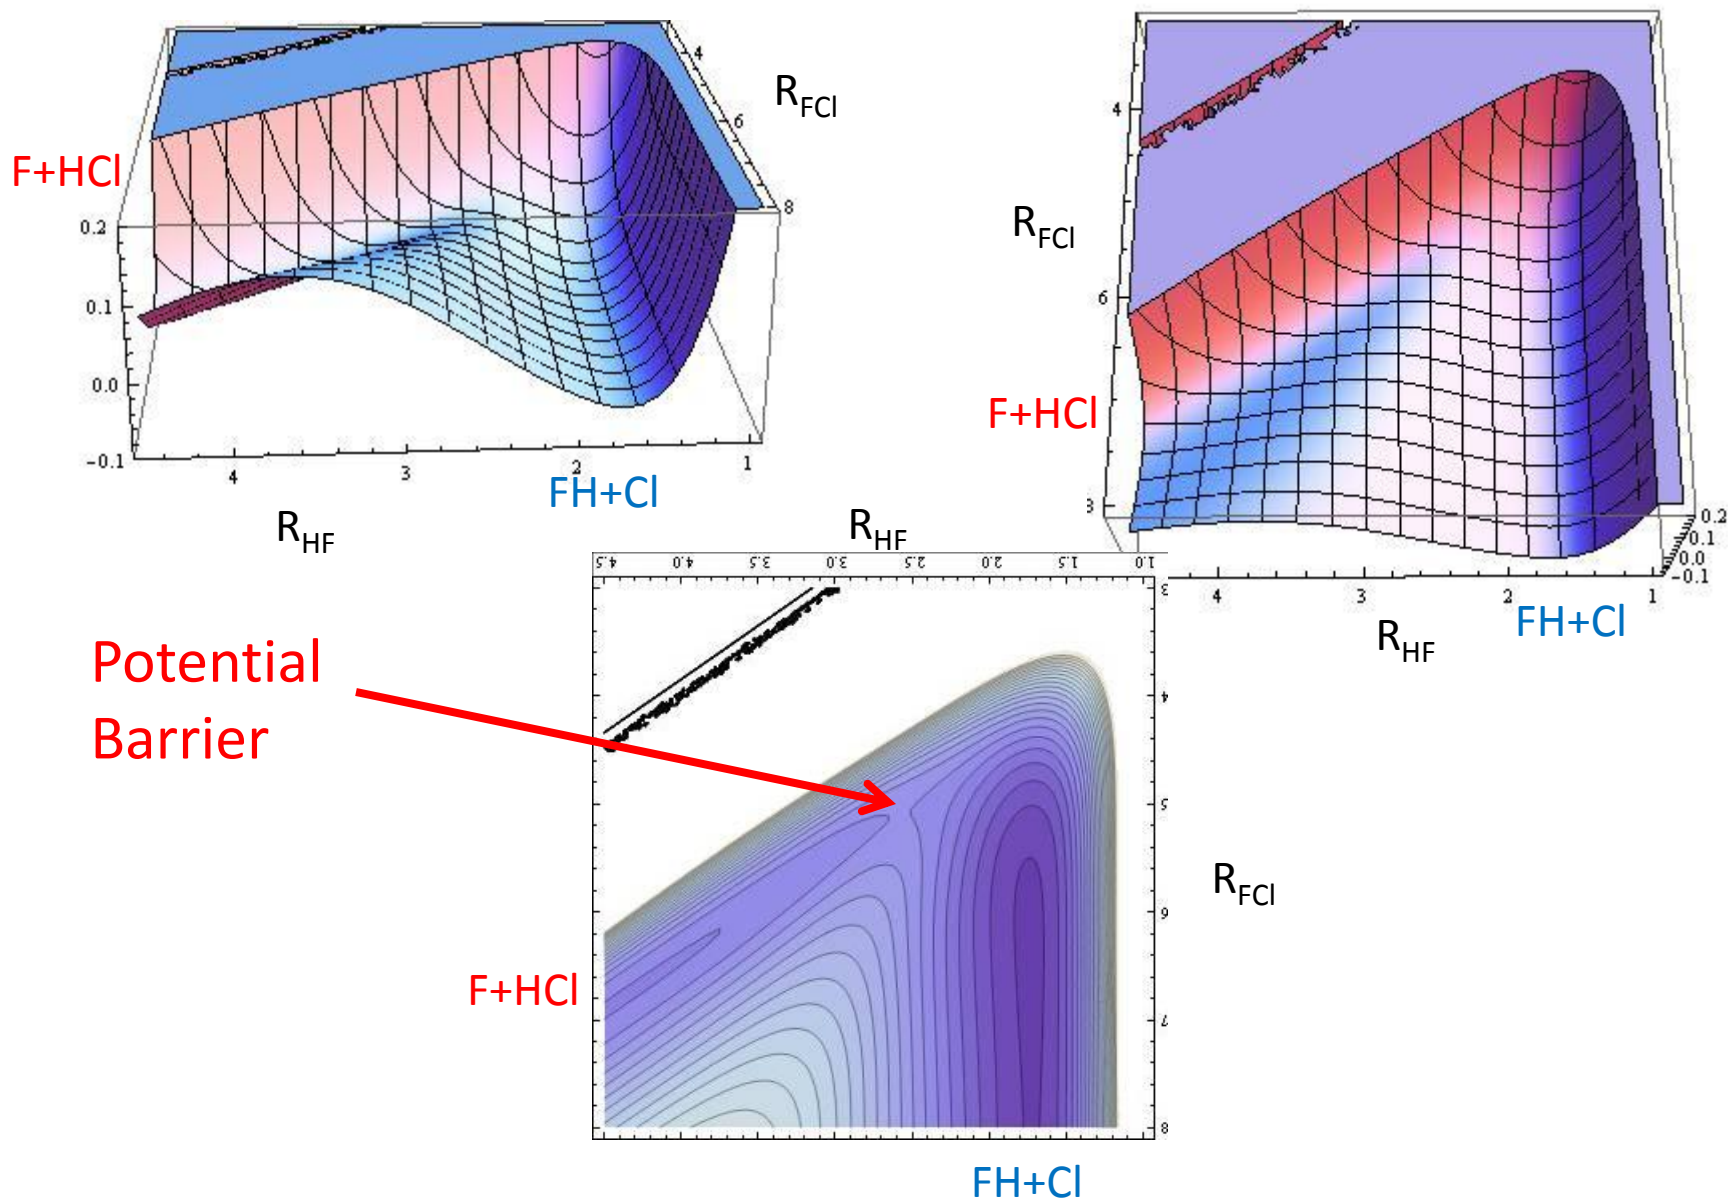

Antisymmetric stretch

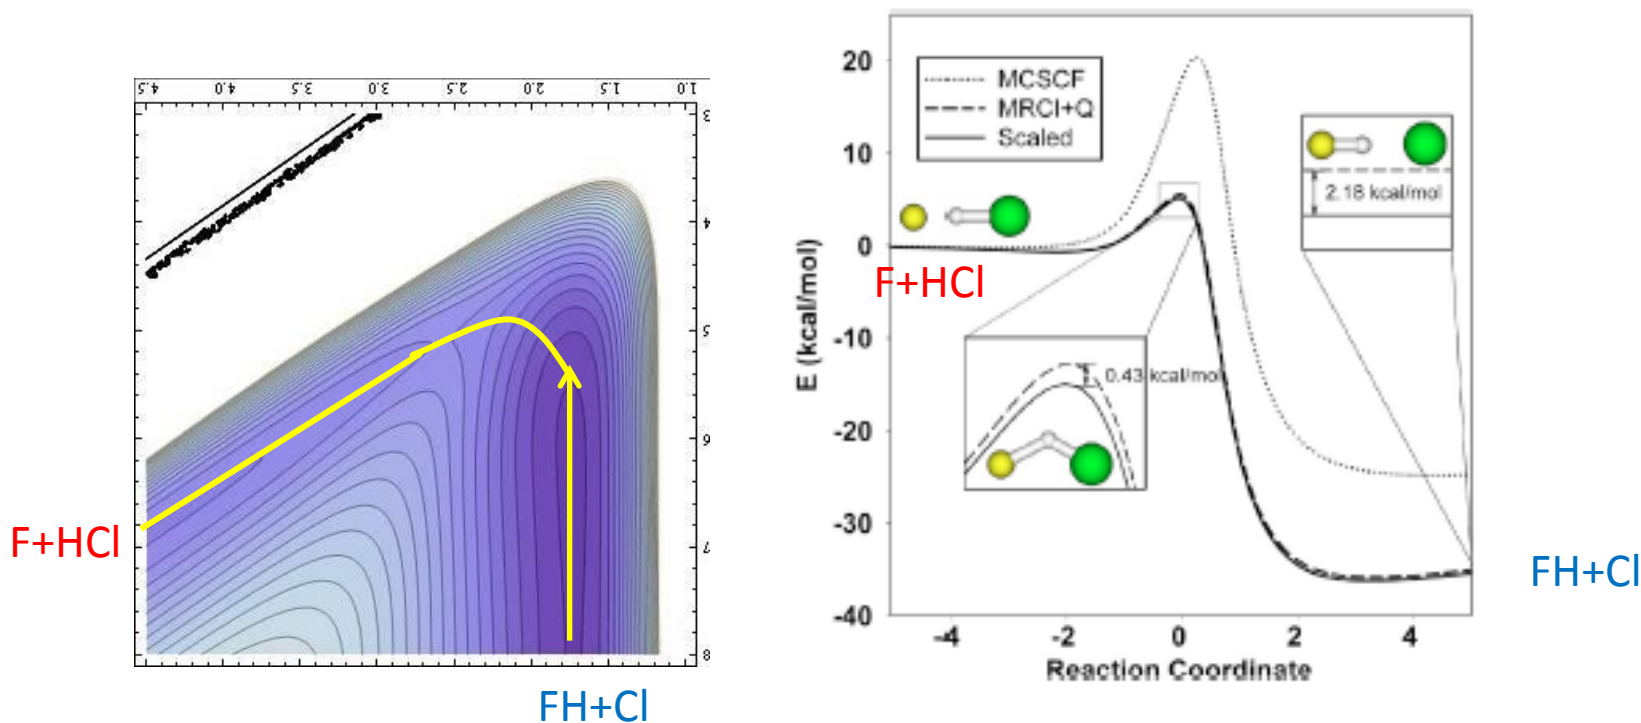

Bend

# $F+HCl \rightarrow FH+Cl$ Potential Energy Surface

Hydrogen Abstraction Reaction, break a HCl bond form a HF bond

# Potential Energy Curve along IRC

You need enough energy to go over the potential barrier to react!  
The minimum energy path that connects the barrier with reactant and product is called intrinsic reaction path  
For F+HCl case you need about 5 kcal/mol of for reaction to occur

# How to quantify Barrier?

- At the barrier the first derivative is zero and the second derivative is negative for one degree of freedom and the rest are always positive. In Gaussian you can use the freq keyword to check if there is imaginary frequency

## Harmonic Oscillator approximation at barrier

$$F = m \frac{d^2 x}{dt^2} = -kx \quad k: \text{force constant} \quad \omega = \sqrt{\frac{k}{m}}$$

In the case of barrier the force constant  $k$  is negative so  $\omega$  is imaginary

# Find the potential Barrier

- Input a geometry that is close to the barrier and use the keyword Opt=(ts)
- Check if the optimized structure is a barrier by calculating the frequency by the freq keyword
- Use the IRC keyword to follow the reaction to the reactant and product keyword IRC(forward), IRC(backward)

# Transition State Theory

- Once you have the barrier you can estimate the thermal rate constant of the reaction from the calculation results! (Assuming that the reaction proceeds along the IRC)

Activated Complex  
(Geometry at Potential Barrier)

$$-\left(\frac{d[A]}{dt}\right) = \frac{k_B T}{h} K^+ [A][B]$$

$K^+$  is the thermal rate constant that depends on temperature

# Things Needed To Calculate Rate Constant

$$K^+ = \frac{Q[(AB)^+]}{Q[A]Q[B]} \exp\left[-\frac{\Delta E}{k_B T}\right]$$

Q is the  
 $\Delta E$  is the

# Partition Function 1

$$Q_{trans} =$$

Usually you consider 1atm pressure

$$\begin{aligned} Q_{electronic} &= D_0 \exp[-\varepsilon_0 / k_B T] + D_1 \exp[-\varepsilon_1 / k_B T] \\ &\quad + D_2 \exp[-\varepsilon_2 / k_B T] + \dots \\ &\rightarrow D_0 \end{aligned}$$

D

# Partition Function 2

$$Q_{rot} = \theta_{A,B,C} = \frac{h^2}{8\pi^2 I_{A,B,C} k_B}$$

$I$  is

$$Q_{vib} =$$

$\nu_i$  is
